Stochastic models of images: what models? what applications?
Agnes Desolneux, CNRS and Ecole Normale Superieure Paris-Saclay

In this talk I will present several models of images as random fields. I will start with generative models under geometric constraints (line segments, or SIFT descriptors), and then present some stochastic models for texture images. These models will be of special interest for applications in medical imaging in particular because they allow virtual clinical trials and help the design of medical imaging systems.
