

Analysis of the controllability of space-time fractional diffusion and super diffusion equations.

Mahamadi Warma, University of Puerto Rico, Rio Piedras Campus

We consider a system of space-time fractional evolution equations involving the fractional Laplace operator and the Caputo time fractional derivative. We give a complete analysis about the controllability of such system. More precisely we shall show what is so far known and what is unknown regarding the exact and/ or the approximate controllability of the above mentioned system.
