Dimitri Zvonkine:Â Double ramification cycles

Given \hat{A} n \hat{A} integers \hat{A} a_1, ..., a_n \hat{A} with vanishing sum, the double ramification cycle \hat{A} DR_g(a_1, ..., a_n) \hat{A} is the locus of stable curves (C, x_1, ..., x_n) such that the divisor \hat{A} sum a_i x_i \hat{A} is principal. We present an explicit formula for the homology class represented by the double ramification cycle.
