## The Wavelet Existence Problem

Darrin Speegle, Saint Louis University
The wavelet existence problem asks for which pairs \$(A, \Gamma)\$ there exists a function $\$ \backslash p s i \$$ such that $\$ \backslash\left\{|A|^{\wedge}\{j / 2\} \backslash \operatorname{psi}\left(A^{\wedge} \mathrm{j} x+\mathrm{k}\right)\right.$ : $\mathrm{j} \backslash$ in $\mathrm{Z}, \mathrm{k} \backslash$ in $\backslash$ Gamma $\left.\backslash\right\} \$$ is an orthonormal basis for $\$ L^{\wedge} 2\left(R^{\wedge} n\right) \$$. The problem is solved in this full generality only in dimension 1. In this talk, I will present some history of the problem, together with some recent results that provide an intriguing connection to the geometry of numbers.
