

A Brief Introduction to Bilby

Sylvia Biscoveanu and Carl Haster for the Bilby Development Team

ICERM Workshop

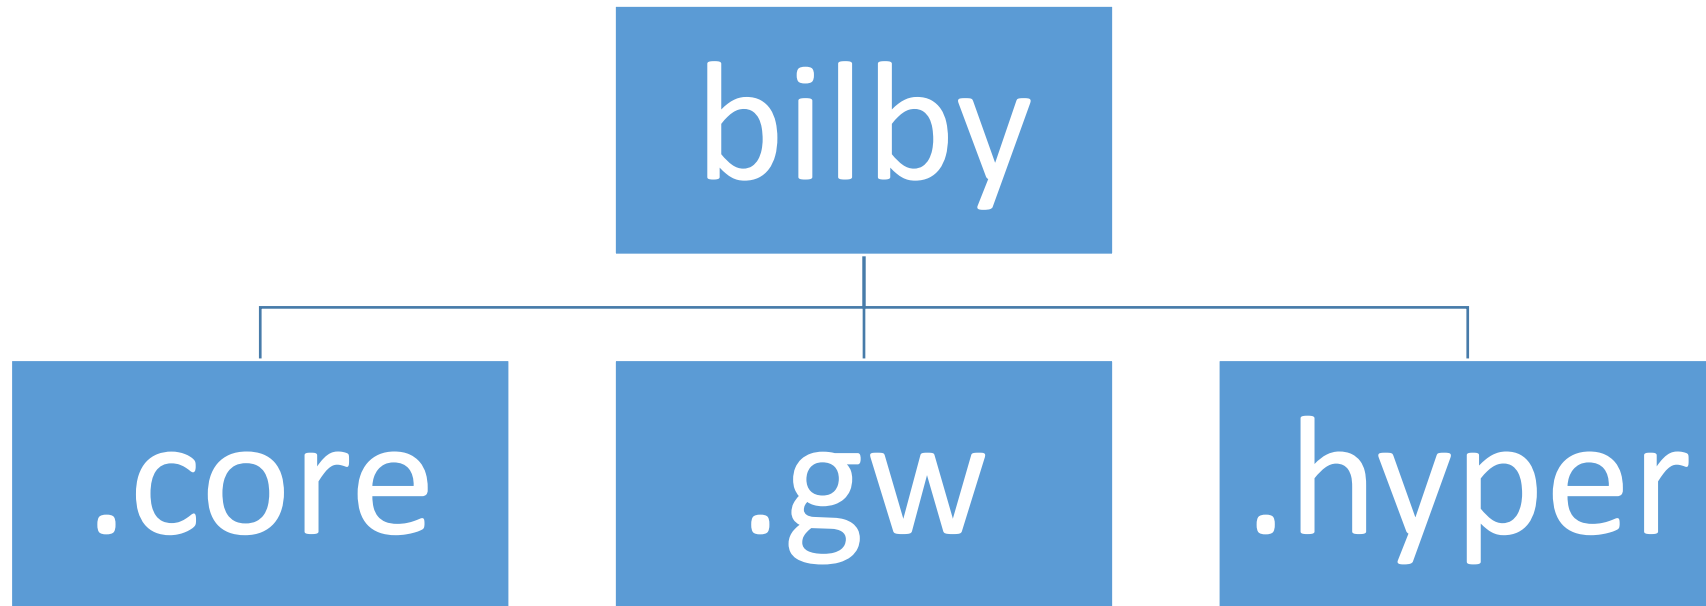

11/19/2020

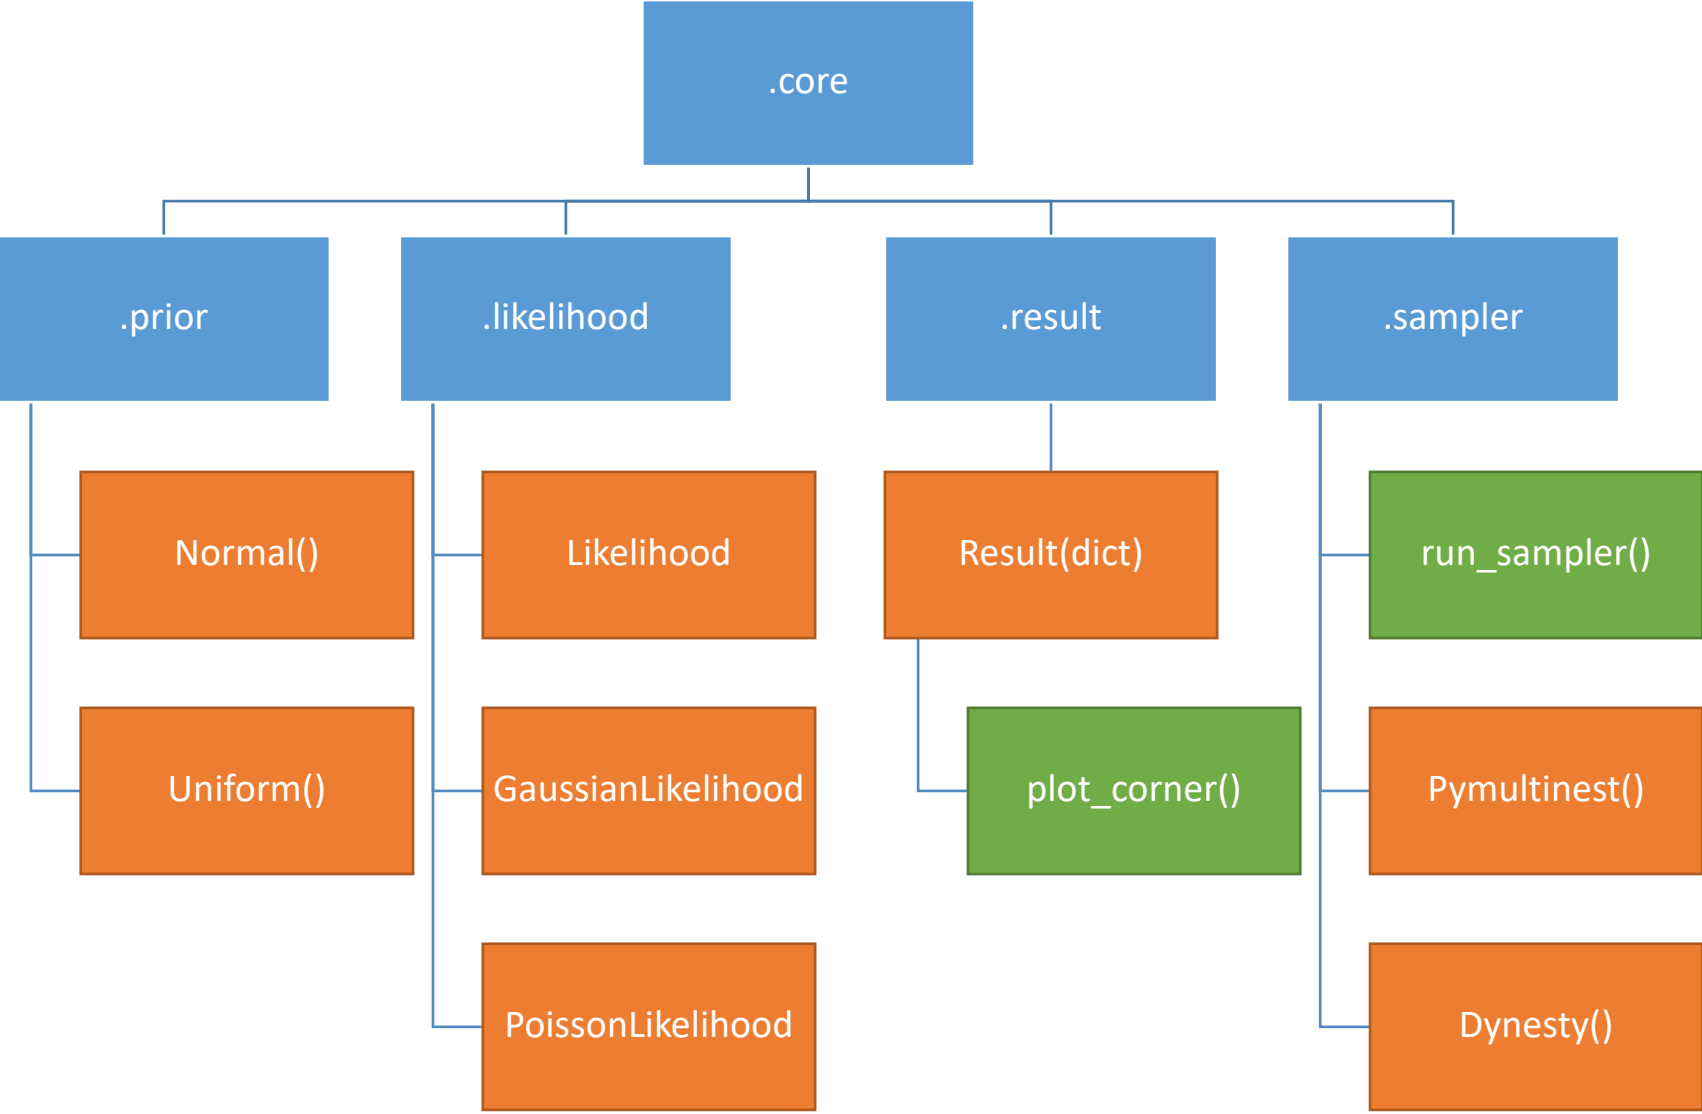

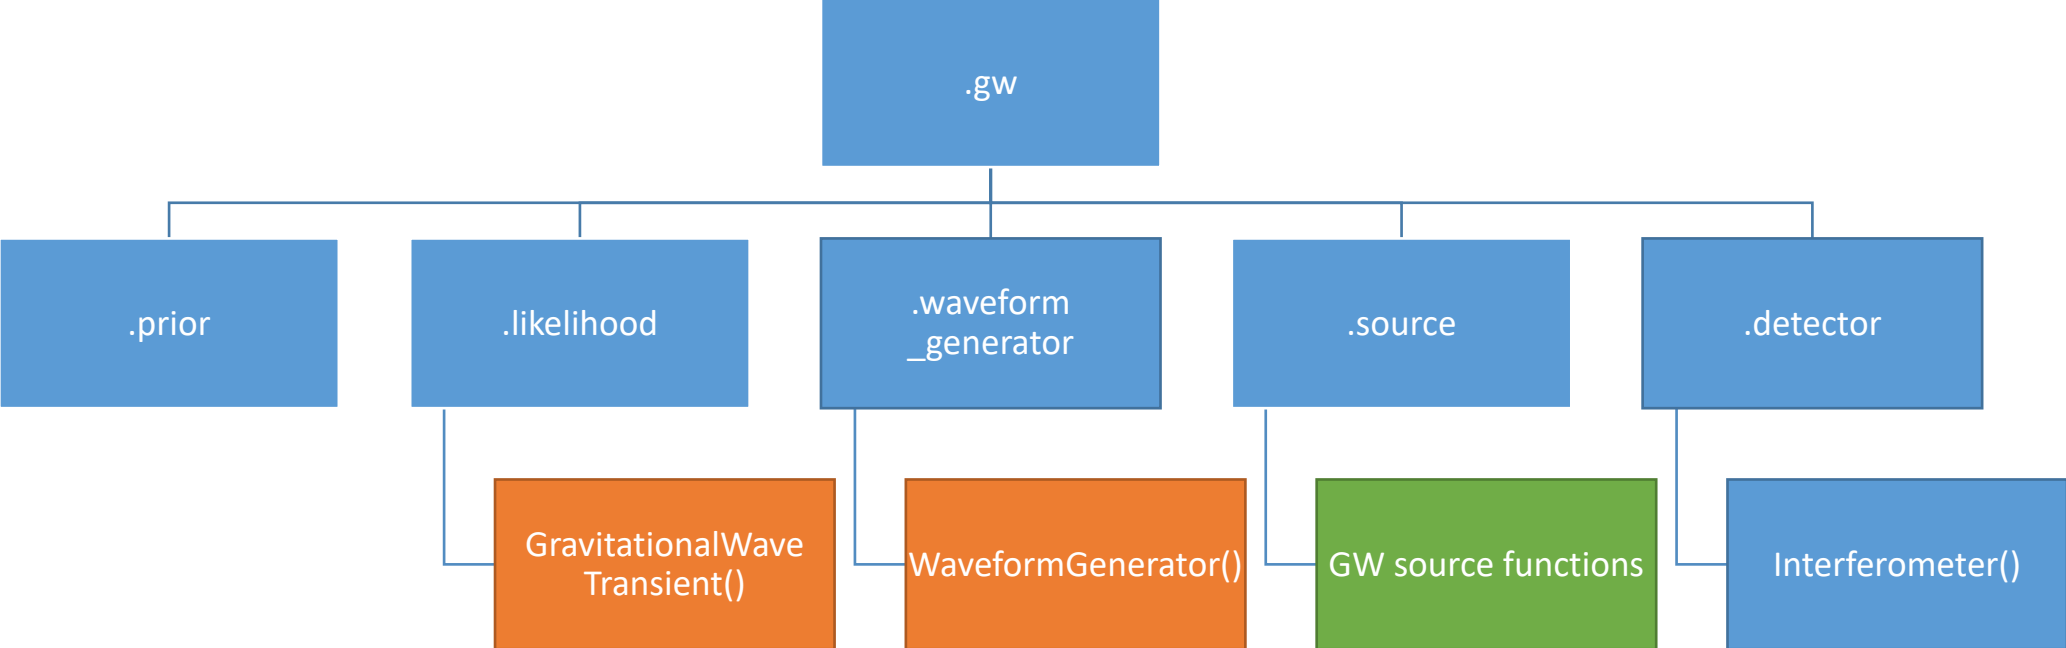

Overview and Installation

- Bilby is a modular Bayesian Inference code written in Python.
- Primarily for compact binary coalescence parameter estimation, but versatile enough for other problems
- Waveforms from lalsimulation, data processing tools from gwpy
- Out of the box use:
 - `pip install bilby`
- Install from source to contribute to developing:
 - Clone from git.ligo.org
 - Full instructions: <https://lscsoft.docs.ligo.org/bilby/installation.html>

Structure

Priors

- Other priors: delta function, power law, log-uniform, cosine, etc.
- Interpolate from a file or array
 - Ex: uniform in comoving volume
- Sample, transform from unit cube, calculate probability
- Group individual parameters into a PriorDict
- Set them from a `.prior` file or directly in the code
- Built-in defaults for CBCs
- Can also set constraints on unsampled parameters

Likelihood

- Common built-in classes like `GaussianLikelihood`, `PoissonLikelihood`, `StudentTLikelihood`
- Write your own likelihood class using the parent `Likelihood`
- For gravitational-wave analyses:
 - `GravitationalWaveTransient`
 - `ROQGravitationalWaveTransient`

Sampling and Output

- Wrapper to external samplers
 - Nested: `pynesty`, `pymultinest`, `nestle`, `cpnest`
 - MCMC: `emcee`, `pymc3`, `ptemcee`
- Saves both the sampler output and the refactored bilby result object
- Bilby output is json file by default, can also save as hdf5
- Results plotted using `corner` package

Gravitational Wave Data

- `WaveformGenerator` object computes the waveform polarizations independent of the detector
- `Interferometer` and `PowerSpectralDensity` objects:
 - Load a default IFO or make your own anywhere in the world with any PSD
 - Calculate the PSD from frame data or load it from a file
 - Load GWOSC event data
 - Generate Gaussian noise
 - Inject signals

Gravitational Wave PE

- Generate injections from the default prior
- Sample in any combination of parameters: chirp mass, total mass, symmetric or asymmetric mass ratio, redshift, comoving distance
- Analytically marginalized likelihoods for time, phase, and distance
- Can also conduct hierarchical inference with the built-in module
