

Generalized Schubert Calculus

ICERM

04.03.2013

①

gives

$$N_0 = N(T)/T,$$

$$\mathfrak{h}_\mathbb{Z}^* = \text{Hom}(T, \mathbb{C}^*),$$

$$\mathfrak{h}_\mathbb{Z} = \text{Hom}(\mathbb{C}, T), \text{ and}$$

$$\mathcal{R}^- = \{ -\alpha \in \mathfrak{h}_\mathbb{Z}^* \text{ appearing in the } T\text{-module } \mathfrak{g}/\mathfrak{h} = \mathfrak{t}(G/B) \}$$

Four cohomologies, Four rings

"Ordinary" cohomology

$$H_T^*(pt) = S(\mathfrak{h}_\mathbb{Z}^*) = \mathbb{C}[x_\lambda \mid \lambda \in \mathfrak{h}_\mathbb{Z}^*] \text{ with } x_{\lambda+\mu} = x_\lambda + x_\mu$$

K-theory

$$K_T(pt) = \mathbb{C}[\mathfrak{h}_\mathbb{Z}^*] = \mathbb{C}[e^\lambda \mid \lambda \in \mathfrak{h}_\mathbb{Z}^*] \text{ with } e^{\lambda+\mu} = e^\lambda e^\mu$$

or, if $x_\lambda = 1 - e^\lambda$ then $x_{\lambda+\mu} = x_\lambda + x_\mu$

Elliptic cohomology

$$E\mathbb{Z}_T(pt) = \text{Th}[\mathfrak{h}_\mathbb{Z}^*] = \text{span} \left\{ \theta_{\lambda+m\Lambda_0} \mid \begin{array}{l} m \in \mathbb{Z}_{\geq 0} \\ \lambda \in \mathfrak{h}_\mathbb{Z}^* \text{ mod } m\mathfrak{h}_\mathbb{Z} \end{array} \right\}$$

Cobordism

$$\Omega_T(pt) = \mathbb{L}[\mathfrak{h}_\mathbb{Z}^*] = \mathbb{L}[\mathbb{L}[x_\lambda \mid \lambda \in \mathfrak{h}_\mathbb{Z}^*]] \text{ with } x_{\lambda+\mu} = x_\lambda \oplus x_\mu.$$

where \mathbb{L} is the ring generated by $a_{11}, a_{12}, a_{21}, a_{31}, \dots$

$$x \oplus y = x + y + a_{11}xy + a_{12}xy^2 + a_{21}x^2y + \dots$$

and a_{ij} satisfy relations forced by

$$x \oplus y = y \oplus x, \quad x \oplus (y \oplus z) = (x \oplus y) \oplus z, \quad x \oplus (0x) = 0$$

$$\text{and } x \oplus 0 = x$$

The Borel model

ICERM
04.03.2013 (2)

$$H_T^*(G/B) = \frac{\mathbb{C}[x_1, \dots, x_n, y_1, \dots, y_n]}{\langle f(x) - f(y) \mid f(x) \in \mathbb{C}[x_1, \dots, x_n]^{W_0} \rangle} = S(\mathfrak{h}^*) \otimes S(\mathfrak{h}^*)^{W_0} S(\mathfrak{h}^*)$$

$$K_T(G/B) = \frac{\mathbb{C}[x_1^{\pm 1}, \dots, x_n^{\pm 1}, y_1, \dots, y_n]}{\langle f(x) - f(y) \mid f(x) \in \mathbb{C}[x_1^{\pm 1}, \dots, x_n^{\pm 1}]^{W_0} \rangle} = \mathbb{C}[\mathfrak{h}^*] \otimes \mathbb{C}[\mathfrak{h}^*]^{W_0} \mathbb{C}[\mathfrak{h}^*]$$

$$E\Omega_T(G/B) = \text{Th}[\mathfrak{h}^*] \otimes \text{Th}[\mathfrak{h}^*]^{W_0} \text{Th}[\mathfrak{h}^*]$$

$$\Omega_T(G/B) = \frac{\mathbb{K}[\{x_\lambda, y_\mu \mid \lambda, \mu \in \mathfrak{h}^+\}]}{\langle f(x) - f(y) \mid f(x) \in \mathbb{K}[\{x_\lambda\}]^{W_0} \rangle} = \Omega_T(\text{pt}) \otimes_{\Omega_G(\text{pt})} \Omega_T(\text{pt})$$

Remark These are four versions of the Chevalley-Shephard-Todd theorem:

- $S(\mathfrak{h}^*)$ is a free $S(\mathfrak{h}^*)^{W_0}$ -module,
- $\mathbb{C}[\mathfrak{h}^*]$ is a free $\mathbb{C}[\mathfrak{h}^*]^{W_0}$ -module,
- $\text{Th}[\mathfrak{h}^*]$ is a free $\text{Th}[\mathfrak{h}^*]^{W_0}$ -module,
- $\Omega_T(\text{pt})$ is a free $\Omega_G(\text{pt})$ -module and

$$\Omega_G(\text{pt}) = \Omega_T(\text{pt})^{W_0}$$

The moment graph model

The T -fixed points $\{wB \mid w \in W_0\}$ in G/B provide

$$z_w: \mathfrak{pt} \rightarrow G/B \quad \text{and} \quad \Phi: \bigoplus_{w \in W_0} \Omega_T(G/B) \xrightarrow{z_w^*} \bigoplus_{w \in W_0} \Omega_T(\mathfrak{pt})$$

$$* \mapsto wB$$

i.e. the following map is an injective ring homomorphism

$$\frac{\mathbb{Z}[\Sigma_{\lambda, \mu}]}{\langle f(x) - f(y) \mid f \in \mathbb{Z}[\Sigma_{\lambda, \mu}]^{W_0} \rangle} \xrightarrow{\Phi} \bigoplus_{w \in W_0} \mathbb{Z}[\Sigma_{\mu}]$$

$$f(x) \mapsto (wf(y))_{w \in W_0}$$

$$g(y) \mapsto (g(y))_{w \in W_0}$$

Parabolics, pullbacks and pushforwards

A parabolic subgroup of G is $P_J \supseteq B$ such that G/P_J is a projective variety.

$$\pi_J: G/B \rightarrow G/P_J \quad \text{gives} \quad \pi_J^*: \Omega_T(G/P_J) \rightarrow \Omega_T(G/B)$$

$$q_B \mapsto q_{P_J} \quad (\pi_J)_!: \Omega_T(G/B) \rightarrow \Omega_T(G/P_J)$$

which are

$$\Omega_T(\mathfrak{pt}) \otimes_{\Omega_G(\mathfrak{pt})} \Omega_T(\mathfrak{pt}) \xrightarrow{\pi_J^*} \Omega_T(\mathfrak{pt}) \otimes_{\Omega_G(\mathfrak{pt})} \Omega_T(\mathfrak{pt})$$

and

$$(\pi_J)_! = \left(\sum_{w \in W_J} t_w \right) \prod_{-\alpha \in R_J^-} x_{-\alpha}$$

where W_J is the subgroup of W_0 corresponding to $P_J \leq G$
 R_J^- are the negative roots in $T(G/P_J)$
 and t_w acts as w on the left factor of $\Omega_T(\mathfrak{pt}) \otimes \Omega_T(\mathfrak{pt})$

BGG operators A_i

ICERM
04.03.2013

(4)

If P_i is a minimal parabolic $P_i \neq B$ then

$$A_i = (\pi_i)_! = (1 + t_i) \frac{1}{x - \alpha_i}$$

See papers of the Ottawa group and collabs (Zainoulline et al) for much information on the Calculus of these on cobordism.

Bott-Samelson classes $[z_{i_1 \dots i_\ell}]$

Let $s_{i_1} \dots s_{i_\ell}$ be a sequence (not necessarily reduced).

$$[z_{i_1 \dots i_\ell}] = A_{i_1} \dots A_{i_\ell} [z_{pt}]$$

where

$$[z_{pt}]_w = \begin{cases} \prod_{-\alpha \in R^-} y - \alpha, & \text{if } w = 1, \\ 0, & \text{if } w \neq 1. \end{cases}$$

Schubert classes I think that there exist unique $[X_w]$, $w \in W_0$, characterized by

(a) $[X_w] \in \text{im } \Phi$,

(b) $[X_w]_w = \prod_{\substack{-\alpha \in R^- \\ w\alpha \notin R^-}} y - \alpha$ and $[X_w]_v = 0$ unless $v \leq w$,

(c) If $\lambda \in \mathfrak{h}^*$ is dominant (i.e. in $\sum_{i=1}^n \mathbb{Z}_{\geq 0} \omega_i$) then

$$x_{-\lambda} [X_w] = \sum_{v \in W_0} c_{\lambda v}^w [X_v] \quad \text{with } c_{\lambda v}^w \in \mathbb{Z}_{\geq 0}[[y_{-\omega_1}, \dots, y_{-\omega_n}]]$$

where $\mathbb{Z}_{\geq 0} = \mathbb{Z}_{\geq 0}[[a_{11}, a_{12}, a_{21}, \dots]]$.

Remarks

(1) If $w = s_{i_1} \cdots s_{i_\ell}$ is reduced then

$$[Z_{i_1 \cdots i_\ell}] = [X_w] \text{ in } \underbrace{H_T^*(G/B)}_{\text{all } a_{ij} = 0} \text{ and } \underbrace{K_T(G/B)}_{\substack{\text{all } a_{ij} = 0 \\ \text{except } a_{ii}}}$$

but $[Z_{ii}] \neq [X_{s_i s_i}]$ in $\Omega_T(G/B)$ for type A_2

(2) I would guess that

$$[X_u][X_v] = \sum_{w \in W_0} c_{uv}^w [X_w] \text{ with } c_{uv}^w \in \mathbb{L}_{\geq 0}[[y_{-\alpha_1}, \dots, y_{-\alpha_n}]]$$

From the tables at the end of Calmes-Petrov-Zainoulline we should not expect such positivity when multiplying Bott-Samelson classes.

(3) I would guess that

$$[X_{s_i w_0}] = x_{-w_i} \oplus y_{w_0 w_i} \text{ in } \Omega_T(G/B)$$

generalizing the formulas

$$x_{-w_i} + y_{w_0 w_i} = [X_{s_i w_0}] \text{ in } H_T^*(G/B) \text{ and}$$

$$1 - x_{-w_i} y_{w_0 w_i} = [X_{s_i w_0}] \text{ in } K_T(G/B).$$
