Why Experiment with Solvers?

- Asymptotic convergence rate
  - Rarely get asymptotics in practice
  - Really want the constant
- Manner of convergence
  - Stationary iterative methods decrease high frequency error quickly
  - Tuminaro, Walker, Shadid, JCP, 180, pp. 549-558 (2002).
- Robustness
  - Line search
  - Solver composition

Outline

Abstract System

Out prototypical nonlinear equation is:

$$\mathcal{F}(\vec{x}) = \vec{b} \tag{1}$$

and we define the residual as

$$\vec{r}(\vec{x}) = \mathcal{F}(\vec{x}) - \vec{b} \tag{2}$$

Abstract System

Out prototypical nonlinear equation is:

$$\mathcal{F}(\vec{x}) = \vec{b} \tag{1}$$

and we define the (linear) residual as

$$\vec{r}(\vec{x}) = A\vec{x} - \vec{b} \tag{3}$$

Linear Left Preconditioning

The modified equation becomes

$$P^{-1}\left(A\vec{x} - \vec{b}\right) = 0 \tag{4}$$

Linear Left Preconditioning

The modified defect correction equation becomes

$$P^{-1}\left(A\vec{x}_i - \vec{b}\right) = \vec{x}_{i+1} - \vec{x}_i \tag{5}$$

Additive Combination

The linear iteration

$$\vec{x}_{i+1} = \vec{x}_i - (\alpha P^{-1} + \beta Q^{-1})(A\vec{x}_i - \vec{b}) \qquad (6)$$

becomes the nonlinear iteration

Additive Combination

The linear iteration

$$\vec{x}_{i+1} = \vec{x}_i - (\alpha P^{-1} + \beta Q^{-1})\vec{r}_i \tag{7}$$

becomes the nonlinear iteration

Additive Combination

The linear iteration

$$\vec{x}_{i+1} = \vec{x}_i - (\alpha P^{-1} + \beta Q^{-1})\vec{r}_i \tag{7}$$

becomes the nonlinear iteration

$$\vec{x}_{i+1} = \vec{x}_i + \alpha(\mathcal{N}(\mathcal{F}, \vec{x}_i, \vec{b}) - \vec{x}_i) + \beta(\mathcal{M}(\mathcal{F}, \vec{x}_i, \vec{b}) - \vec{x}_i) \tag{8}$$

Nonlinear Left Preconditioning

From the additive combination, we have

$$P^{-1}\vec{r} \Longrightarrow \vec{x}_i - \mathcal{N}(\mathcal{F}, \vec{x}_i, \vec{b}) \tag{9}$$

so we define the preconditioning operation as

$$\vec{r}_L \equiv \vec{x} - \mathcal{N}(\mathcal{F}, \vec{x}, \vec{b}) \tag{10}$$

Multiplicative Combination

The linear iteration

$$\vec{x}_{i+1} = \vec{x}_i - (P^{-1} + Q^{-1} - Q^{-1} A P^{-1}) \vec{r}_i \tag{11}$$

becomes the nonlinear iteration

Multiplicative Combination

The linear iteration

$$\vec{x}_{i+1/2} = \vec{x}_i - P^{-1}\vec{r}_i \tag{12}$$

$$\vec{x}_i = \vec{x}_{i+1/2} - Q^{-1}\vec{r}_{i+1/2} \tag{13}$$

becomes the nonlinear iteration

Multiplicative Combination

The linear iteration

$$\vec{x}_{i+1/2} = \vec{x}_i - P^{-1}\vec{r}_i \tag{12}$$

$$\vec{x}_i = \vec{x}_{i+1/2} - Q^{-1}\vec{r}_{i+1/2} \tag{13}$$

becomes the nonlinear iteration

$$\vec{x}_{i+1} = \mathcal{M}(\mathcal{F}, \mathcal{N}(\mathcal{F}, \vec{x}_i, \vec{b}), \vec{b}) \tag{14}$$

Nonlinear Right Preconditioning

For the linear case, we have

$$\begin{aligned} AP^{-1}\vec{y} &= \vec{b} \qquad (15) \\ \vec{x} &= P^{-1}\vec{y} \qquad (16) \end{aligned}$$

so we define the preconditioning operation as

$$\begin{aligned} \vec{y} &= \mathcal{M}(\mathcal{F}(\mathcal{N}(\mathcal{F}, \cdot, \vec{b})), \vec{x}_i, \vec{b}) \qquad (17) \\ \vec{x} &= \mathcal{N}(\mathcal{F}, \vec{y}, \vec{b}) \qquad (18) \end{aligned}$$

$$\approx \sum_b J_b(\vec{x}_{b*})^{-1} J(\vec{x})$$

This would require

- one inner nonlinear iteration
- small number of block solves

per **outer nonlinear** iteration.

Dimensional Formulation

$$\frac{\partial\phi}{\partial t} - \nabla\cdot(1-\phi)\vec{v}^S = 0$$

$$\nabla\cdot\left(-\frac{K_\phi}{\mu}\nabla p + \vec{v}^S\right) = 0$$

$$\nabla p - \nabla\zeta_\phi(\nabla\cdot\vec{v}^S) - \nabla\cdot\left(2\eta_\phi\dot{\epsilon}^S\right) = 0$$

Closure Conditions

$$K_\phi = K_0 \left(\frac{\phi}{\phi_0}\right)^n$$

$$\eta_\phi = \eta_0 \exp\left(-\lambda(\phi - \phi_0)\right)$$

$$\zeta_\phi = \zeta_0 \left(\frac{\phi}{\phi_0}\right)^{-m}$$

Nondimensional Formulation

$$\frac{\partial \phi}{\partial t} - \nabla \cdot (1 - \phi)\vec{v}^S = 0$$

$$\nabla \cdot \left(-\frac{R^2}{r_\zeta + 4/3} \left(\frac{\phi}{\phi_0} \right)^n \nabla p + \vec{v}^S \right) = 0$$

$$\nabla p - \nabla \left(\left(\frac{\phi}{\phi_0} \right)^{-m} \nabla \cdot \vec{v}^S \right) - \nabla \cdot \left(2e^{-\lambda(\phi - \phi_0)} \dot{\epsilon}^S \right) = 0$$

Initial and Boundary conditions

Initially

$$\phi = \phi_0 + A\cos(\vec{k} \cdot \vec{x})$$

where

$$A \ll \phi_0$$

and on the top and bottom boundary

$$K_\phi \nabla p \cdot \hat{n} = 0$$

$$\vec{v}^S = \pm\frac{\dot{\gamma}}{2}\hat{x}$$

Composing scalable nonlinear solvers,

What Are We Missing?

We need a short time convergence theory:

- Most iterations never enter the asymptotic regime
- Most complex solvers are composed

We need a viable nonlinear smoother:

- GS is too expensive for FEM
- NASM is a possibility,

Nonlinear GMRES

```
procedure NGMRES($\mathcal{F}, \vec{x}_i \cdots \vec{x}_{i-m+1}, \vec{b}$)
    $\vec{d}_i = -\vec{r}(\vec{x}_i)$
    $\vec{x}_i^M = \vec{x}_i + \lambda\vec{d}_i$
    $\mathcal{F}_i^M = \vec{r}(\vec{x}_i^M)$
    minimize $\|\vec{r}((1 - \sum_{k=i-m}^{i-1}\alpha_i)\vec{x}_i^M + \sum_{k=i-m}^{i-1}\alpha_k\vec{x}_k)\|_2$ over $\{\alpha_{i-m}\cdots\alpha_{i-1}\}$
    $\vec{x}_i^A = (1 - \sum_{k=i-m}^{i-1}\alpha_i)\vec{x}^M + \sum_{k=i-m}^{i-1}\alpha_k\vec{x}_k$
    $\vec{x}_{i+1} = \vec{x}_i^A$ or $\vec{x}_i^M$ if $\vec{x}_i^A$ is insufficient.
end procedure
return $\vec{x}_{i+1}$
```

Can emulate Anderson mixing and DIIS

Nonlinear GMRES

```
procedure NGMRES($\mathcal{F}, \vec{x}_i \cdots \vec{x}_{i-m+1}, \vec{b}$)
    $\vec{d}_i = -\vec{r}(\vec{x}_i)$
    $\vec{x}_i^M = \vec{x}_i + \lambda \vec{d}_i$
    $\mathcal{F}_i^M = \vec{r}(\vec{x}_i^M)$
    minimize $\| \vec{r}((1 - \sum_{k=i-m}^{i-1} \alpha_i) \vec{x}_i^M + \sum_{k=i-m}^{i-1} \alpha_k \vec{x}_k) \|_2$ over $\{\alpha_{i-m} \cdots \alpha_{i-1}\}$
    $\vec{x}_i^A = (1 - \sum_{k=i-m}^{i-1} \alpha_i) \vec{x}^M + \sum_{k=i-m}^{i-1} \alpha_k \vec{x}_k$
    $\vec{x}_{i+1} = \vec{x}_i^A$ or $\vec{x}_i^M$ if $\vec{x}_i^A$ is insufficient.
end procedure
return $\vec{x}_{i+1}$
```

Can emulate Anderson mixing and DIIS

Full Approximation Scheme (FAS)

Nonlinear Multigrid

```
procedure FAS($\vec{F}, \vec{x}_i, \vec{b}$)
        $\vec{x}_s = \mathcal{M}_s(\mathcal{F}, \vec{x}_i, \vec{b})$
        $\vec{x}_c = \widehat{\mathbf{R}}\vec{x}_s$
        $\vec{b}_c = \mathcal{F}_c(\vec{x}_c) - \mathbf{R}[\mathcal{F}(\vec{x}_s) - \vec{b}]$
        $\vec{x}_s = \vec{x}_s + \mathbf{P}[\mathrm{FAS}(\vec{F}_c, \vec{x}_c, \vec{b}_c) - \vec{x}_c]$
    $\vec{x}_{i+1} = \mathcal{M}_s(\mathcal{F}, \vec{x}_s, \vec{b})$
end procedure
return $\vec{x}_{i+1}$
```
